

# Finally, there is a blood test for **early cancer detection** in dogs

Dear Pet Parent,

For the first time ever, your veterinarian can detect cancer with a simple blood draw.

**OncoK9®** is a first-in-class multi-cancer early detection (MCED) test. It utilizes the same cutting-edge genomic sequencing technology that is revolutionizing early cancer detection in human patients. It can detect **30** different cancer types, including the most common cancers in dogs.

***Cancer is by far the single most common cause of death in dogs.*** Approximately six million dogs are diagnosed with the disease annually in the United States. Unfortunately, cancer is typically diagnosed at an advanced stage, when treatment options are limited. All too often, it cuts short the lives of dogs who might have enjoyed many healthy years with their families had the disease been found sooner. Early detection is critical for the best outcome.

## **OncoK9 is recommended as an annual cancer screening test:**

- Starting at 7 years of age in all dogs
- Starting as early as 4 years of age in dogs belonging to breeds at higher risk of cancer

*Scan the QR code on the bottom of the page to find out the recommended age to start screening your dog for cancer.*

As with any laboratory test, OncoK9 results should be interpreted by a veterinarian in the context of each patient's medical history and clinical presentation. The test is available by prescription only.

**For more information about an OncoK9 test for your dog, please ask a member of our staff or call us at 760-436-3215**
